

Note that in case when all sets B_i have exactly 2 elements (i.e. $b = 2$), the Hitting Set problem is equivalent to the Vertex Cover problem (two-element sets B_i correspond to edges). In the chapter we saw two approximation algorithm for Vertex Cover; here we generalize the one based on linear programming to arbitrary b .

Consider the following problem for Linear Programming:

$$\begin{aligned} \text{Min} \quad & \sum_{i=1}^n w_i x_i \\ \text{s.t.} \quad & 0 \leq x_i \leq 1 \quad \text{for all } i = 1, \dots, n \\ & \sum_{i: a_i \in B_j} x_i \geq 1 \quad \text{for all } j = 1, \dots, m \text{ (all sets are hit)} \end{aligned}$$

Let x be the solution of this problem, and w_{LP} is a value of this solution (i.e. $w_{LP} = \sum_{i=1}^n w_i x_i$).

Now define the set S to be all those elements where $x_i \geq 1/b$:

$$S = \{a_i \mid x_i \geq 1/b\}$$

(1) S is a hitting set.

Proof. We want to prove that any set B_j intersects with S . We know that the sum of all x_i where $a_i \in B_j$ is at least 1. The set B_j contains at most b elements. Therefore some $x_i \geq 1/b$, for some $a_i \in B_j$. By definition of S , this element $a_i \in S$. So, B_j intersects with S by a_i . ■

(2) The total weight of all elements in S is at most $b \cdot w_{LP}$.

Proof. For each $a_i \in S$ we know that $x_i > 1/b$, i.e., $1 < bx_i$. Therefore

$$w(S) = \sum_{a_i \in S} w_i \leq \sum_{a_i \in S} w_i \cdot bx_i \leq b \sum_{i=1}^n w_i x_i = bw_{LP}$$

■

(3) Let S^* be the optimal hitting set. Then $w_{LP} \leq w(S^*)$.

Proof. Set $x_i = 1$ if a_i is in S^* , and $x_i = 0$ otherwise. Then the vector x satisfy constraints of our problem for Linear Programming:

$$\begin{aligned} 0 \leq x_i \leq 1 \quad & \text{for all } i = 1, \dots, n \\ \sum_{i: a_i \in B_j} x_i \geq 1 \quad & \text{for all } j = 1, \dots, m \text{ (because all sets are hit)} \end{aligned}$$

Therefore the optimal solution is not worse than this particular one. That is,

$$w_{LP} \leq \sum_{i=1}^n w_i x_i = \sum_{a_i \in S^*} w_i = w(S^*)$$

■

Therefore we have a hitting set S , such that $w(S) \leq b \cdot w(S^*)$.
