

*4-Dimensional Matching* is in NP, since we can check in  $O(n)$  time, using an  $n \times 4$  array initialized to all 0, that a given set of  $n$  4-tuples is disjoint.

We now show that *3-Dimensional Matching*  $\leq_P$  *4-Dimensional Matching*. So consider an instance of *3-Dimensional Matching*, with sets  $X$ ,  $Y$ , and  $Z$  of size  $n$  each, and a collection  $C$  of ordered triples. We define an instance of *4-Dimensional Matching* as follows. We have sets  $W$ ,  $X$ ,  $Y$ , and  $Z$ , each of size  $n$ , and a collection  $C'$  of 4-tuples defined so that for every  $(x_j, y_k, z_\ell) \in C$ , and every  $i$  between 1 and  $n$ , there is a 4-tuple  $(w_i, x_j, y_k, z_\ell)$ . This instance has a size that is polynomial in the size of the initial *3-Dimensional Matching* instance.

If  $A = (x_j, y_k, z_\ell)$  is a triple in  $C$ , define  $f(A)$  to be the 4-tuple  $(w_j, x_j, y_k, z_\ell)$ ; note that  $f(A) \in C'$ . If  $B = (w_i, x_j, y_k, z_\ell)$  is a 4-tuple in  $C'$ , define  $f'(B)$  to be the triple  $(x_j, y_k, z_\ell)$ ; note that  $f'(B) \in C$ . Given a set of  $n$  disjoint triples  $\{A_i\}$  in  $C$ , it is easy to show that  $\{f(A_i)\}$  is a set of  $n$  disjoint 4-tuples in  $C'$ . Conversely, given a set of  $n$  disjoint 4-tuples  $\{B_i\}$  in  $C'$ , it is easy to show that  $\{f'(B_i)\}$  is a set of  $n$  disjoint triples in  $C$ . Thus, by determining whether there is a perfect 4-Dimensional matching in the instance we have constructed, we can solve the initial instance of *3-Dimensional Matching*.
